Hardware Information

Chapter 2 – Hardware Information

2.2 Jumpers and Connectors

2.3 List of Jumpers

The board has a number of jumpers that allow you to configure your system to suit your application.

The table below shows the function of each of the board's jumpers

Label	Function
JP3	ATX/AT Mode Selection
JP1	CMOS Control Selection

2.3.1 Setting Jumpers

You can configure your system to match the needs of your application by setting jumpers. A jumper is the simplest kind of electric switch. It consists of two metal pins and a small metal clip (often protected by a plastic cover) that slides over the pins to connect them. To “close” a jumper you connect the pins with the clip.

To “open” a jumper you remove the clip. Sometimes a jumper will have three pins, labeled 1, 2 and 3. In this case you would connect either pins 1 and 2 or 2 and 3.

A pair of needle-nose pliers may be helpful when working with jumpers.

If you have any questions about the best hardware configuration for your application, contact your local distributor or sales representative before you make any changes.

Generally, you simply need a standard cable to make most connections.

2.5 Hardware Assembly

This section details the hardware assembly steps for the BOXER-6406-ADN. Please read this section thoroughly before beginning installation and ensure you have all necessary peripheral hardware ready.

2.5.1 2.5" SATA Drive Installation

Before installing the SATA Drive, ensure the system is powered down and disconnect the power cord from the system. Make sure you have the SATA Drive ready to install.

Step 1: Remove the eight (8) screws from the bottom of the chassis to remove the bottom panel from the system. Then attach the SATA drive to the HDD Bracket using the four (4) screws provided.

Step 2: Attach the assembled HDD to the HDD Base Bracket using four screws as shown in the figure below. Please use the rubber washers provided when affixing HDD to bracket. Attach the SATA and SATA Power cables to the board and the SATA drive.

2.5.2 M.2 Module Installation

The M.2 2230 E-Key, M.2 2280 M-Key, and Mini Card slots are accessible by removing the bottom panel.

Follow standard procedures for expansion card installation, aligning the notch on each M.2 SSD with its respective key slot.

2.5.3 DIMM Heatsink Installation

Note: As the BOXER-6406U-ADN supports both single and double-sided DDR5 modules, please ensure to follow the below guidance on thermal pad thickness.

DDR5 Type	Thermal Pad
Single	2.0mm
Double	1.0mm

Follow the below diagram to install DIMM heatsink, ensuring a DIMM thermal pad is placed between the DIMM heatsink and DIMM module.

2.5.4 Wall Mount Installation

For wall mount assembly, affix the two (2) wall mount brackets to the bottom side of the chassis using the four (4) screws provided.

Chapter 3

AMI BIOS Setup

3.1 System Test and Initialization

The system uses certain routines to perform testing and initialization. If an error, fatal or non-fatal, is encountered, a few short beeps or an error message will be outputted. The board can usually continue the boot up sequence with non-fatal errors.

The system configuration verification routines check the current system configuration against the values stored in the CMOS memory. If they do not match, an error message will be outputted, in which case you will need to run the BIOS setup program to set the configuration information in memory.

There are three situations in which you will need to change the CMOS settings:

- You are starting your system for the first time
- You have changed your system's hardware
- The CMOS memory has lost power and the configuration information is erased

The system's CMOS memory uses a backup battery for data retention, which is to be replaced once emptied.

3.2 AMI BIOS Setup

The AMI BIOS ROM has a pre-installed Setup program that allows users to modify basic system configurations, which is stored in the battery-backed CMOS RAM and BIOS NVRAM so that the information is retained when the power is turned off.

To enter BIOS Setup, press or <F2> immediately while your computer is powering up.

The function for each interface can be found below.

Main – Date and time can be set here. Press <Tab> to switch between date elements

Advanced – Enable/Disable boot option for legacy network devices

System I/O – Enable/Disable system I/O device

Security – The setup administrator password can be set here

Boot – Enable/Disable quiet Boot Option

Save & Exit – Save your changes and exit the program

A parity bit can be sent with the data bits to detect some transmission errors. Even: parity bit is 0 if the num of 1's in the data bits is even. Odd: parity bit is 0 if num of 1's in the data bits is odd. Mark: parity bit is always 1. Space: Parity bit is always 0. Mark and Space Parity do not allow for error detection. They can be used as an additional data bit.
